SUMMARY

Eight years across the stack: application code, data pipelines, CI/CD, and the Kubernetes underneath. I usually end up wherever the gap is between what a team needs and what actually ships. At Accuris, that has meant building an MCP mesh that gives every team governed access to 250+ tools and handling operations for 100+ microservices across 6 regions. Before that, I was the first engineering hire at an AI startup, working directly with its founders and enterprise clients.

EXPERIENCE

Accuris · Engineering reference data and workflow software

Remote

Principal Software Engineer

Mar 2026 – Present

- Built and launched the MCP mesh on AgentGateway: one governed entry point to 250+ tools for engineering, product, and cross-functional teams, with Entra ID auth and centralized observability
- Designed and shipped production MCP servers that give AI agents natural-language access to internal systems
- Grew the AI plugin library into how teams use AI day to day, turning one-off prompts into repeatable workflows
- Operate 100+ microservices on Kubernetes across 6 regions; led the multi-region buildout of compute and data tiers
- Help map out and drive the standardization of deployment and CI/CD across 1,000+ repositories with templated Kubernetes
- Own architecture and cost across 70+ AWS accounts, reviewing designs with teams for cost and security
- Build and run CDC pipelines from PostgreSQL into Databricks for mission-critical data

Senior Software Engineer

Apr 2025 – Mar 2026

- Led the move of 1,000+ repositories to GitHub and consolidated CI onto GitHub Actions with reusable workflows
- Built the first internal MCP servers and the original AI plugin library

Forml · No-code predictive AI platform

Remote

Senior Full Stack Engineer

Jan 2025 – Apr 2025

Full Stack Engineer

Aug 2024 – Jan 2025

- First engineering hire; worked directly with the founders and enterprise clients to scope requirements, set quarterly roadmaps, and ship the platform end to end (Python, Angular, AWS, PostgreSQL)
- Built one-click on-prem deployment for enterprise clients, cutting onboarding from 3 days to 4 hours and unblocking deals that required customer-hosted installs
- Led the API and architecture work that carried the platform through 2x user growth in 2 months; promoted to Senior

Project Canary · Emissions monitoring for the energy industry

Denver, CO

DevOps Engineer

May 2023 – Aug 2024

- Built a self-service tool that lets developers and QA deploy an isolated test environment from any branch in one click, with selectable data sources and automatic cleanup
- Built a RAG search app on AWS Bedrock and vector databases for querying internal documents across departments
- Ran observability for 10+ critical services (99.99% uptime) and moved it to New Relic, cutting monitoring costs 14%
- Fixed bottlenecks in high-throughput time-series PostgreSQL databases, improving query performance 23%
- Drove the security work behind passing SOC 2 Type I and Type II, automating controls and cutting audit prep ~30%

Lendflow · Embedded lending software

Remote

DevSecOps Engineer

Aug 2021 – May 2023

- Centralized logging on OpenSearch, cutting the time to pinpoint production issues from ~3 hours to under 10 minutes
- Built ephemeral dev and QA environments to replace always-on ones, cutting environment costs 32%
- Put AWS WAF and CloudFront in front of the platform, reducing security incidents 60%
- On-call engineer for a platform serving 20K+ users; cut average ticket resolution time 25%

MCG Health · Clinical guidance software

Remote

DevOps Engineer

Mar 2020 – Aug 2021

- Led the migration from on-prem infrastructure to Azure for 3+ teams
- Built modular Terraform components that cut new environment setup from ~2 days to 1 hour
- Moved configuration management for 100+ Windows servers from Chef to Ansible, with Datadog monitoring

Cerner · Electronic health records

Kansas City, MO

Systems Engineer

Oct 2018 – Mar 2020

- Wrote Ansible playbooks for server configuration and troubleshooting, saving the team 40+ hours a month
- Built an AWX-based portal for scheduling data restores and spinning up ephemeral test environments
- Taught biweekly Linux fundamentals sessions for new hires through Cerner's Tech Academy

SKILLS

AI & agents	MCP, AgentGateway, Claude Code, GitHub Copilot, AWS Bedrock, RAG and vector search
Platform	Kubernetes (EKS), AWS, Azure, GCP, Terraform, Helm, ArgoCD, Docker, Ansible
Data	PostgreSQL, Databricks, Snowflake, TimescaleDB, Redis, MySQL
Delivery & observability	GitHub Actions, Azure DevOps, Jenkins, New Relic, Datadog, Prometheus, OpenSearch
Languages	Python, TypeScript, Bash, Java, C#/.NET

OPEN SOURCE

Sauce · Agentic operating loop for Obsidian

github.com/willfell/sauce

- Turns notes into node-based work graphs that agents like Claude Code and Codex run in isolated workers
- Handles scheduling, retries, agent handoffs, and a persistent task store; ships via Homebrew under MIT

EDUCATION

Wichita State University

Wichita, KS

Management Information Systems

2014 – 2018
