### EXPERIENCE

#### Accuris

Accuris delivers engineering and technical reference data and workflow software to manufacturers and standards bodies.

#### Principal Software Engineer

03/2026 - Present • Remote

- Built and launched the MCP mesh on AgentGateway, giving engineering, product, and cross-functional teams governed access to 250+ tools with Entra ID auth and centralized observability
- Designed and shipped multiple production MCP servers exposing internal systems to AI agents through natural language
- Built and maintain the plugin library that standardizes how teams use AI day to day, turning one-off prompts into repeatable workflows
- Operate 100+ microservices on multi-region Kubernetes across 6 regions; led the multi-region expansion of compute and data tiers for multiple core services
- Help map out and drive the projects standardizing deployment patterns and CI/CD across 1,000+ repositories with template-driven Kubernetes
- Own architecture and cost management across 70+ AWS accounts, consulting with teams on design, cost, and security
- Build and operate CDC pipelines from PostgreSQL into Databricks for mission-critical data
- Act as technical consultant to engineering teams across the company on architecture, deployment, and AI adoption

#### Senior Software Engineer

04/2025 - 03/2026 • Remote

- Led the migration of 1,000+ repositories to GitHub and consolidated CI onto GitHub Actions with shared reusable workflows
- Built the first internal MCP servers and the plugin library that standardized how teams use AI day to day

#### Senior Full Stack Engineer

##### Forml

08/2024 - 04/2025 • Remote

Forml is a startup offering a no-code platform for creating predictive AI models. It features document scanning tools and AI-driven data querying capabilities.

- First engineering hire. Worked directly with founders and enterprise clients to scope requirements, build quarterly roadmaps, and ship the platform end to end (Python, Angular, AWS, PostgreSQL)
- Built one-click on-prem deployment for enterprise clients, cutting onboarding from 3 days to 4 hours and unblocking deals that required customer-hosted installs
- Scaled the platform to 2x users in 2 months through API and architecture work, earning promotion to Senior

#### DevOps Engineer

##### Project Canary

05/2023 - 08/2024 • Denver

Project Canary helps energy companies reduce emissions through advanced sensors and analytics. Its solutions provide actionable environmental data.

### SUMMARY

Eight years across the stack: data, application logic, deploys, the Kubernetes underneath, the alerting on top. I usually end up wherever the gap is between what a client needs and what actually ships. Lately that's agentic AI infrastructure. At Accuris I built the MCP mesh connecting 250+ tools to every team, handle operations for 100+ microservices across 6 regions, and help map out the work standardizing CI/CD across 1,000+ repos. Before that, first engineering hire at an AI startup, working with founders and enterprise clients.

### SKILLS

#### AI & Agent Platforms

MCP, AgentGateway, Claude Code, GitHub Copilot, AWS Bedrock, RAG, Databricks

#### Infrastructure & Platforms

Kubernetes, EKS, AWS, Terraform, Docker, Azure, GCP, Ansible

#### Observability & Reliability

New Relic, Prometheus, Datadog, CloudWatch, OpenSearch, Splunk, Redis, Timescale

#### CI/CD & Developer Enablement

GitHub Actions, ArgoCD, Helm, Azure DevOps, GitOps, Jenkins, Pytest, Cypress

#### Languages

Python, TypeScript, JavaScript, Bash, Java, C#/.NET

#### Data

PostgreSQL, Databricks, Snowflake, MySQL, Redis, TimescaleDB

### OPEN SOURCE

#### Sauce

github.com/willfell/sauce  
Agentic operating loop for Obsidian. Node-based agent execution with isolated workers, scheduling, and a persistent task store. Versioned vault platform shipped via Homebrew, MIT.

- Created a full-stack retrieval augmented generation application using AWS Bedrock and vector databases, increasing cross-departmental information access efficiency by 80%
- Orchestrated enterprise-wide observability strategy for 10+ critical services, implementing proactive monitoring that maintained 99.99% uptime
- Built a self-service ephemeral environment tool with a UI for branch selection, data sources, and one-click deployment, streamlining testing and accelerating development
- Architected performance optimizations for high-throughput time-series PostgreSQL databases, resolving critical production bottlenecks that improved query performance by 23%
- Planned and executed migration of observability infrastructure to New Relic, reducing monitoring costs by 14% and improving cross-service visibility and reliability

## DevSecOps Engineer

### Lendflow

08/2021 - 05/2023 · Remote

Lendflow provides embedded lending software, helping businesses access capital, increase revenue, and boost customer engagement.

- Enhanced logging and observability by implementing a centralized OpenSearch solution, reducing issue identification time from ~3 hours to under 10 minutes and significantly improving MTTR
- Built ephemeral infrastructure solutions for developers and QA, eliminating persistent environment costs by 32%
- Served as on-call engineer, ensuring 99.9999% uptime for 20K+ users by managing incident response, reducing average ticket resolution time by 25%, and improving overall system reliability

## DevOps Engineer

### MCG

03/2020 - 08/2021 · Remote

MCG Health delivers AI-driven clinical guidance, simplifying healthcare decisions and optimizing patient care.

- Led migration from on-premises infrastructure to Azure Cloud for 3+ teams, achieving 99.9999% annual uptime and reducing client error reports by 27%
- Migrated configuration management from Chef to Ansible for 100+ Windows servers, reducing configuration errors by 82% and improving system visibility through Datadog integration
- Designed modular Terraform components to standardize cloud infrastructure, accelerating new environment setup from approximately 2 days to 1 hour while consistently enforcing security best practices

## Systems Engineer

### Cerner

10/2018 - 03/2020 · Kansas City

Cerner offers electronic health record (EHR) systems, enhancing healthcare efficiency and patient outcomes.

- Built an AWX-powered UI for scheduling data restoration jobs and spinning up ephemeral test environments, enabling seamless developer workflows
- Managed patching, upgrades, and support for 600+ hosts in vSphere, ensuring system stability and security across production and non-production environments
- Created Ansible playbooks to automate server configuration and troubleshooting, saving the team 40+ hours per month by eliminating manual tasks

## ACHIEVEMENTS

---

### MCP Mesh at Scale

Built the agent tooling platform connecting 250+ tools to every team at Accuris with Entra governance and full observability.

### Security Compliance & Readiness

Drove security initiatives essential to passing SOC 2 Type I and Type II audits through automated controls and proactive compliance measures.

### Hackathon 3rd Place

Placed 3rd out of 50 teams in a Cerner hackathon, collaborating on an idempotent solution for deploying and managing a Confluent Kafka stack using Ansible.

## EDUCATION

---

### Management Information Systems

#### Wichita State University

2014 - 2018 · Wichita

## VOLUNTEERING

---

### Tech Academy Instructor

#### Cerner

2018 - 2020

Conducted biweekly four-hour sessions to educate new hires on fundamental Linux concepts and efficient system utilization.
